Istituto di Genetica  
Via Sant 'Epifanio, 14  
Pavia, Italy

Dear Luca:

A suggestion has been made for a possible subject that you might want to join in on by way of some experimental collaboration during your visit next year. This would have to do with the role of genotype in the individuality of patterns of evoked potentials. There are a couple of people here who are very actively doing these kinds of studies on monkeys, people and cats, and while they have very good physiological techniques at their disposal, they don't have very much understanding about genetic methodology. In particular, I talked to Bert Kopell, and he expressed very considerable interest in that kind of collaboration. I suggest this in case you want to do some introductory reading on the subject.

Sincerely yours,

Joshua Lederberg  
Professor of Genetics

ACALLY
